

/hai — Week 3 Report

Sai Pranavi Jeedigunta | Mycroft Project 29

July 13 — July 19, 2026

Hours Log

Date	Activity	Hours
Mon July 13	Google Sheet update, article published on Mycroft Substack, email to Shradha, repo pulled and set up in VSCode, began n8n workflow analysis	4.0
Tue July 14	n8n workflow analysis Nodes 1-13, fixed PostgreSQL connection, loaded schema, traced input/output for each node	6.0
Wed-Sat July 15-19	Completed Nodes 14-21 analysis, full 21-node bug registry documented across all five pipeline phases	10.0
Total		20.0

Accomplishments

1. Published first Mycroft Substack article

'The Scanner That Cannot Read' published on mycroftproject.substack.com — processed through CRITIQ and Eddy, all checks cleared. Link: <https://mycroftproject.substack.com/p/the-scanner-that-cannot-read>

2. Ran the full Project 29 n8n workflow end to end

Set up local PostgreSQL database with the correct schema, fixed database credentials pointing to Darshan's remote server, ran the workflow for the first time since the original Fellow built it. 292 regulatory articles ingested and processed in a single execution.

3. Completed full 21-node input/output analysis

Traced every node across all five pipeline phases — ingestion, normalization, scoring, routing, and alerting. Documented 5 critical bugs, 2 fragile nodes, and 2 flawed logic nodes. The system was never formally audited before this week.

Bug Registry — All 21 Nodes

Node	Function	Status	Key Flaw
1	Schedule Trigger	Operational	None
2-6	RSS Feed Readers	Vulnerable	Google News returns redirect URLs instead of canonical sources
7	Merge	Operational	None
8	Normalize Data	Critical Bug	Non-financial Federal Register items mislabeled as Securities
9	Filter Valid Content	Critical Bug	Drops valid SEC press releases with empty content bodies
10	Urgency Scoring	Critical Flaw	Baseline score 5 inflates non-financial noise to Medium impact

11	Prepare Data	Vulnerable	Hand-rolled SQL escaping instead of parameterized queries
12	Insert DB	Critical Flaw	Raw string-interpolated SQL crashes on unescaped characters
13	Filter Inserted	Fragile	Volatile console logs, no persistent metrics
14	If2 Router	Operational	None
15	Generate HTML	Flawed Logic	Threshold mismatch >7 in report vs >6 in alert nodes
16	Write to Disk	Critical Flaw	Hardcoded Linux path crashes on macOS
17-21	Alert & Email	Operational	Inherits reporting discrepancies from Node 15

Struggle Documentation

The hardest work this week was sustained attention through large, complex node outputs. Each node produced significant data payloads — 121 to 292 items per execution — requiring careful reading to identify what was expected, what was anomalous, and what constituted a genuine bug versus intended behavior. This is Tier 2 work — tacit knowledge built by doing, not by reading documentation.

Tier Justification

Tier 2 — Embodied: Running a workflow you did not build, tracing every input and output manually, identifying bugs that are not visible from documentation alone. This knowledge cannot be acquired by reading. It required running the system.

Tier 4 — Judgment and Supervision: Distinguishing between bugs and intended behavior requires judgment. The Node 9 SEC blind spot and Node 8 mislabeling bug are not obvious from the README — they only become visible when you run the system on real data and observe what gets dropped and what gets through.

Tier 5 — Causal Reasoning: The mislabeling bug in Node 8 causes a cascade — non-financial documents flow through keyword scoring, appear in the HTML report as high-priority alerts, and get emailed to compliance officers. Understanding the causal chain from source classification to final alert is what makes the fix strategy coherent.

Unresolved

- Week 3 article not yet written
- All 5 critical bugs documented but not yet fixed
- Email and file path still pointing to Darshan's credentials
- Evaluation benchmark not yet started
- Video report requirement just announced — need to create and upload weekly video to Google Drive

Next Steps — Week 4

- Begin fixing the 5 critical bugs — Node 8 source mislabeling and Node 9 SEC blind spot first

- Update email addresses and file paths from Darshan's credentials to working values
- Publish Week 3 article by Tuesday — topic to be confirmed based on workflow audit findings
- Create first video report and upload to shared Google Drive
- Update Google Sheet with Week 3 deliverables

Compliance Notes

Item	Status
Volunteer agreement	Signed and countersigned — June 29 to July 31, 2026
SEVP portal	Updated — Humanitarians AI Inc. registered June 29, 2026
Unique ID	241
Unemployment days used	Approximately 11 of 90 allowed
RENEWAL DEADLINE	July 24, 2026 — 5 days away — action required

Generated by Addams — Humanitarians.ai OPT Documentation System
 Week 3 session duration: 20 documented hours
